

```

public class MoveToFrontDictionary<K, V> implements IDictionary<K,V> {
    4 usages
    private Node head;
    5 usages
    private int size;
    6 usages 1 blank *
    private class Node{
        public K key;
        public V value;
        3 usages
        public Node next;

        no usages new *
        public Node(K key, V value, Node next){
            this.key = key;
            this.next = next;
            this.value = value;
        }
    }
    14 usages 1 blank *
    public MoveToFrontDictionary() {
        size = 0;
        head = null;
    }
}

```

I have a question about my constructor. I am not passing the implementation test because I don't have a valid Node class. What am I missing in my constructor?
